CO1 - ATI - Descriptive Written Exam

Question 8 :

Cross - Browser Testing strategy

An e-commerce website must work correctly on chrome, firefox, edge, safari and mobile browsers.

1. Testing strategy :

Prepare common test cases : login, search, product details, cart, checkout and payment.

Execute the same tests on different browsers, devices, and screen sizes.

Compare expected and actual results and record those details.

Perform regression testing after fixing defects.

2. How Defects originates ?

Defects may occur due to :

Differences in CSS and HTML rendering.

Different Javascript / API support.

Browser or OS version differences.

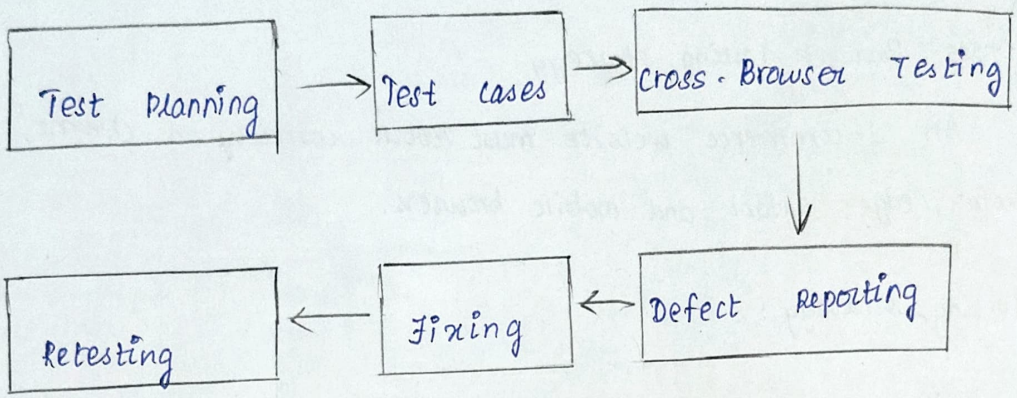

Responsive design problems.

Third - Party components such as payment gateways.

Example : A checkout button may work in chrome but fail in Safari due to JavaScript or rending differences.

3. How systematic Testing improves Reliability.

Process :

It detects defects early, reduces failures and provides a consistent user experience.

4. Tools and Techniques

Tools : Selenium, Playwright, Browserstack, Cypress and Jira.

Techniques : Automation testing, compatability testing, responsive testing, regression testing, visual testing and risk-based testing.

conclusion :

Systematic cross-browser testing ensures the e-commerce applications is reliable, compatible and consistent across browsers and devices.
