CO1 - AT2 - SHORT ANSWERS TEST

CSA3710 - SOFTWARE TESTING

KAVIYA.V
192421022

Questions :-

21. Healthcare system - Inconsistency between modules
22. Early tester involvement in SDLC.
23. System failure during peak usage.
24. Poor defect documentation.
25. Banking system - Repeated transaction failures.

Rubrics :-

Criteria	Weightage	level 4 - Exemplary	Level 3 - Proficient	Level 2 - Developing	level 1 - Begining	Total
conceptual Understanding	30					
Accuracy of answer	25					
Application of knowledge	20					
completeness of responses	15					
clarity & presentation	10					
Total	100					

21) Healthcare system - Inconsistency between modules.

Inconsistency data occurs when more different modules interact or stores data differently.

Testing problem / Procedure :-

* Program integration is choosen to check the communication between user details and modules.

* Verify data by checking the patient's data whether it is stored at different modules for each like registered date, patient details, billing, etc.

* Check the data and ensure for further purposes.

Result : Integration testing and data testing plays a major role in healthcare system, by ensuring both testing we can avoid many issues.

22) Early tester involvement in SDLC.

* Testers involvement in softwares at early stage of the software development life cycle (SDLC).

Importance :

* Testers can identify requirement errors before coding begins.

* They help create test cases based on requirements.

* Early defect detection reduces the cost and time required for fixing defects.

Result :-

Early tester involvement in SDLC helps in between developers, software engineers, testers and stakeholders which improves software quality and reduces delays.

23) System failure during peak usage.

The failure occured because the testing team did not test important usage scenario.

Testing approach :

* Perform load and stress testing to check the system under heavy traffic.
* Test critical scenarios such as many users accessing the system simultaneously.
* Include boundary and real-world usage conditions in test cases.

Result :

Better test coverage Identifies performance problems before deployment and prevents during peak usage.

24) Poor defect documentation.

Proper defect documentation is important for tracking and fixing software problems.

A defect report should contains:

* Defect ID and desription.
* Steps to reproduce the defect.
* Expected and actual result.
* Severity, priority and screenshots if required.

→ Using a defect tracking tool such as Jira helps design, monitor and close defects systematically.

Result:

Good documentation improves defect tracking, communication and analysis.

25) Banking system - Repeated transaction failures.

The banking system needs a structured testing approches because transaction failure causes trouble to customers and financial datas.

Testing approaches:

* Perform functional and integration testing for transactions.
* Test successful, failed, cancelled and duplicate transactions.
* Perform boundary, negative and regression testing after every fix.

Result:-

structured transactions identifies defects early and ensures accurate, secure and reliable banking operations.
